## 2 wiring

### 2.1 Interface Information

The servo driver uses the dual RJ45 terminal as the EtherCAT protocol communication port, and the terminal interface is as shown below. The first interface (the upper interface) is the input interface, and the second interface (the lower interface) is the output interface.

Figure 1.2 Pin Definition

Table 2-1 Communication Signal Connector Pin Definitions

Pin number	name	Features
1	T X +	Receiver signal
2	T X -	Receiver signal
3	RX+	Send signal
4	--	--
5	--	--
6	R X -	Send signal
7	--	--
8	--	--
	shell	shield

### 2.2 Topological connection

The SD700-EtherCAT servo drive topology communication connection is flexible and basically unlimited. The connection topology is as follows.

Linear connection:

Ring redundant connection:

## 2.3 communication cable

The EtherCAT communication cable uses an Ethernet Category 5 (100BASE-TX) network cable or a high-strength shielded network cable. currently using When using the SD700-EtherCAT servo drive, a shielded network cable is also required to enhance the anti-jamming capability.

## 2.4 EMC standard

The SD700-EtherCAT servo drive implements the IEC/EN61800-3:2004 (Adjustable speed electrical power drive systems-part3: EMC requirements and specific test methods) standard and the GB/t12668.3 national standards.

# 3 EtherCAT communication network settings

The EtherCAT communication network setting steps are as follows:

1. Import the XML file; (refer to the main site of the field application, determine the import method)
2. EtherCAT mode parameter setting; (refer to section 3.1)
3. EtherCAT communication parameter setting; (refer to Section 4.4)
4. Start the remote node. (You can observe section 3.2 to determine the current state)

## 3.1 Parameter setting of EtherCAT mode

In order to enable the servo driver to access the EthrCAT fieldbus network, it is necessary to set the relevant function code of the servo driver.

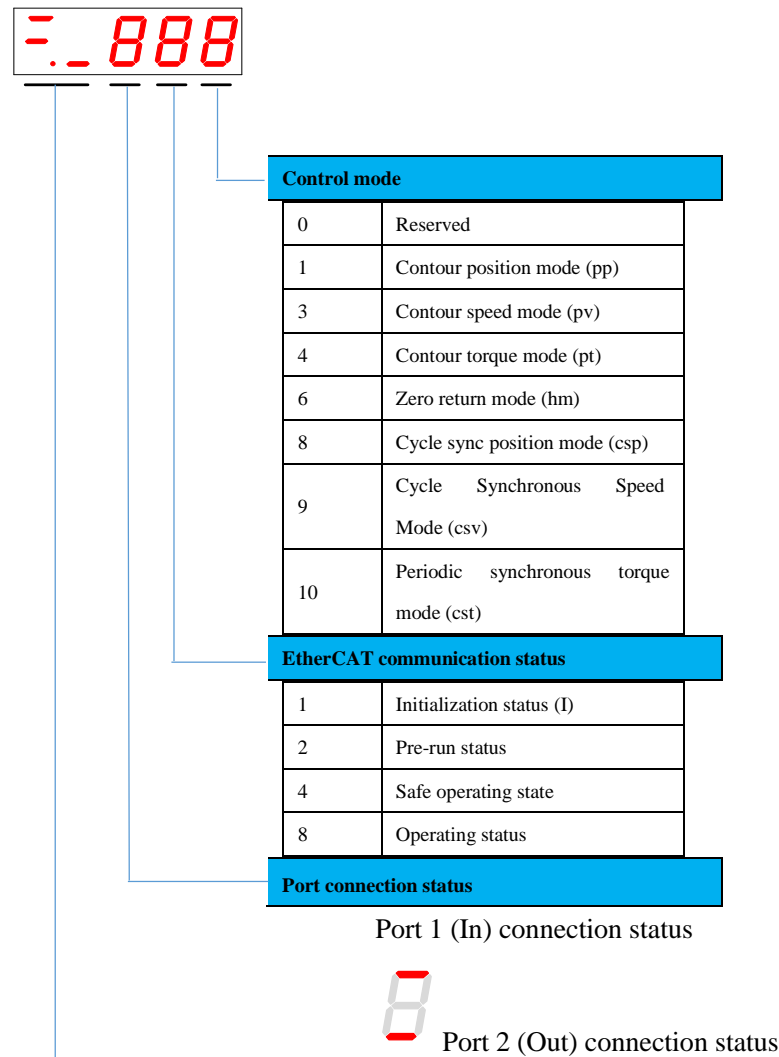

Table 3-3 System Settings Function Code Table

<b>Pn000</b>	<b>Function selection basic switch 0</b>	<b>■</b>	<b>Mailing address: 0x0000</b>
<b>Factory default: 0000</b>	<b>Setting range: 0000 ~ 001B</b>	<b>Unit: N/A</b>	<b>Control mode:</b>

<b>9</b>	Torque mode <-> analog speed
<b>10</b>	Analog speed <-> zero speed mode
<b>11</b>	Position mode <-> pulse inhibit mode
<b>16</b>	<b>EtherCAT mode</b>

**Note:** When set to EtherCAT model, the control mode selection is invalid and the control mode is selected by the master station.

### 3.2 EtherCAT status monitoring

Status	Explanation	Status	Explanation
	On when the control power is ON, off when it is OFF		On when the main circuit power is ON, off when it is OFF
	Speed control : light up when speed is consistent output Position control: On when positioning is completed Torque control : always on		Lights when the rotation checkout (/TGON) output is on
			Speed control: light up when speed command is input Position control: lighted when the position command is being input
	On when servo is OFF, off when servo is ON		Torque control: light up when torque command is input Position control: light up when pulse clear signal is

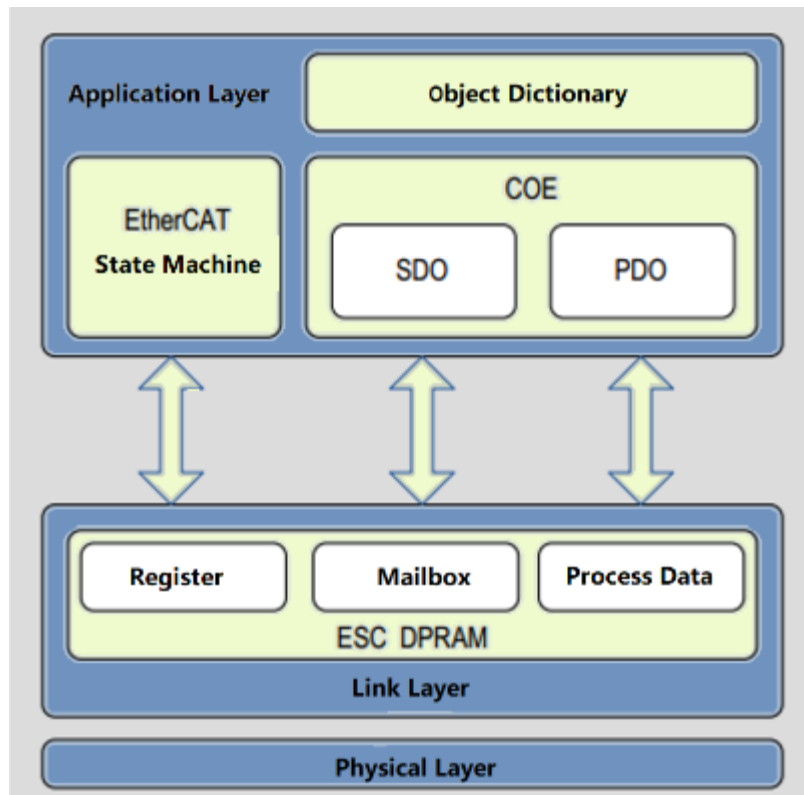

## 4. EtherCAT Communication Foundation

### 4.1 EtherCAT communication specification

Project		Specs
Communication protocol		IEC 61158 Type 12, IEC 61800-7 CiA 402 Drive Profile
Application layer	SDO	SDO request SDO response
	PDO	Variable PDO mapping
	CiA402	Contour position mode (pp)
		Contour velocity mode (pv)
		Contour torque mode (pt)
		Origin reset mode (hm)
Physical layer	Synchronous periodic position mode (csp)	
	Synchronous periodic velocity mode (csv)	
	Synchronous periodic torque mode (cst)	
	Transport protocol	100BASE-TX (IEEE802.3)
Physical layer	Maximum distance	100M
	Interface	RJ45 * 2 ( INT、 OUT)

### 4.2 Communication structure

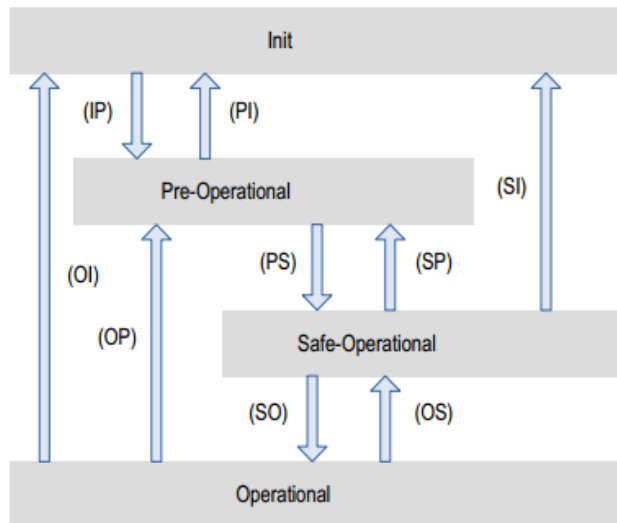

There are a variety of application layer protocols for using EtherCAT communication, but the SD700 servo driver described in this manual uses the IEC 61800-7 (CiA402)-CANopen motion control sub-protocol. The figure below shows the EtherCAT communication structure based on the CANopen application layer.

In the structure diagram, the application layer object dictionary contains communication parameters, service data objects (SDO), and process data objects (PDO). The PDO process data objects contain real-time data in the servo operation for periodic reading and writing. SDO mailbox communication is configured and accessed by aperiodic configuration of some communication parameter objects.

### 4.3 EtherCAT state machine

The following is a block diagram of the EtherCAT state transition:

The SD700-EtherCAT servo drive supports four state transitions and is responsible for coordinating the state transitions of the master and slave from initialization to runtime. The following table shows the relevant operations performed inside the initialization state to the running state servo.

State or state transition	Internal related operations
Initialization (I)	There is no communication on the application side, the master can only read and write the ESC register.
Initialize to pre-run conversion Init to Pre-Op (IP)	Master configuration slave station register Configure mailbox channel parameters Configuring distributed clock (DC) related registers The master writes a status control register to request a pre-run status
Pre-run (P)	Application layer mailbox data communication
Pre-run to convert to safe operation Pre-Op to Safe-Op (PS)	Master uses mailbox initialization process data mapping SM channel used by the master station configuration process data communication Master station configuration FMMU The master writes a status control register to request a safe operating state
Safe operation (S)	Application layer supports mailbox data communication There is process data communication, but only input data is allowed to be read, and no output signal is generated.
Safe running to run conversion Safe-Op to Op(SO)	The master sends valid output data The master writes a status control register to request a run status
Operating status (O)	Input and output are all valid Still using mailbox communication

## 4.4 Process Data

Real-time process data (PDO), following the producer - consumer model. The PDO can be divided into RPDO (Receive PDO) and TPDO (Transmit PDO). The slave receives the master command via RPDO and sends its own status information to the master via TPDO.

### 4.4.1 PDO Mapping Parameters

The PDO mapping is used to establish a mapping relationship between the object dictionary and the PDO. In the SD700-EtherCAT driver, 1600h~1603h is RPDO, and 1A00h~1A03h is TPDO. The following table shows information about the PDO mapping and mapping objects of the product, and the mapping objects can be changed.

PDO	index	Maximum number of maps	Longest mapped byte	Default mapping object
RPDO	1600h	8 Ge	32	6040h (control word) 607Ah (target location) 60FFh (target speed) 6071h (target torque) 6060h ( operating mode )
	1601h	8 Ge	32	6040h (control word) 607Ah ( target location )
	1602h	8 Ge	32	6040h (control word) 60FFh ( target speed )
	1603h	8 Ge	32	6040h (control word) 6071h ( target torque )
TPDO	1A00h	8 Ge	32	6041h (status word) 6064h (actual location) 606Ch (actual speed) 6077h ( actual torque )
	1A01h	8 Ge	32	6041h (status word) 6064h ( actual location )
	1A02h	8 Ge	32	6041h (status word) 6064h (actual location) 606Ch ( actual speed )
	1A03h	8 Ge	32	6041h (status word) 6064h (actual location) 6077h ( actual torque )

Note: It is recommended that the total number of RPDO and TPDO mapping bytes does not exceed 52 bytes, which may affect the servo performance.

#### 4.4.2 PDO Synchronization Management Assignment Settings

In periodic data communication, the process data may include multiple PDO mapping objects. The CoE protocol uses the data objects 0x1C10~0x1C2F to define a list of PDO mapping objects of the corresponding synchronous management channels. Multiple PDOs may be mapped in different sub-indexes of 0x1C10~0x1C2F. In the SD700-EtherCAT servo drive, supports only 1 th RPDO and 1 th TPDO allocated in the following table:

Index	Subindex	Mapping assignment	Default map assignment
0x1C12	01h	Select one of 1600h~1603h as the RPDO application	1600h
0x1C13	01h	Select one of 1A00h~1A03h as the TPDO application	1A00h

#### 4.4.3 PDO Configuration

The PDO mapping parameters (e.g., 1600h) contain pointers to the process data of the PDO that the PDO needs to send or receive, including the index of the mapping object, the sub-index, and the length of the object. The mapping parameter sub-index 0 records the number N of mapping objects of the PDO (for example, the maximum value of the SD700-EtherCAT servo N is 8), and one or more objects can be mapped at the same time. Sub-indexes 1 to 8 are mapping contents (mapping objects). The mapping parameter content is defined as follows.

Number of digits	31	.....	16	15	.....	8	7	.....	0
meaning	index			Subindex			Object length		

The index and the sub-index together determine the position of the object in the object dictionary. The length of the object indicates the specific bit length of the object, namely:

Object length	Bit length
08h	8 digits
10h	16 bits
20h	32 -bit

For example, the mapping parameter of object 6040h-00 is 60400010h.

The configuration process of PDO is as follows:

1. Cancel PDO. The 1C12h (or 1C13h) of 00h subindex write 0;
2. Clear the original mapping content. Write 0 to the 00h subindex of the mapping parameter (such as 1600h-00) to clear the original mapping content;
3. Write the PDO mapping content. Write the mapping parameter sub-index 1~N (N max is 8) according to the above definition;
4. Write the total number of PDO mapping objects. Step 3 The number of map N write mapping parameter subindex 0 (e.g. 1600h-00 write N);
5. Enable PDO. The 1C12h (or 1C13h) of 00h subindex write 1.

#### 4.5 Mailbox Data SDO

The mailbox data SDO is used to transmit aperiodic data, such as the configuration of communication parameters, the configuration of servo drive operating parameters, and the like. In the SD700-EtherCAT servo drive, SDO requests and SDO are currently supported.

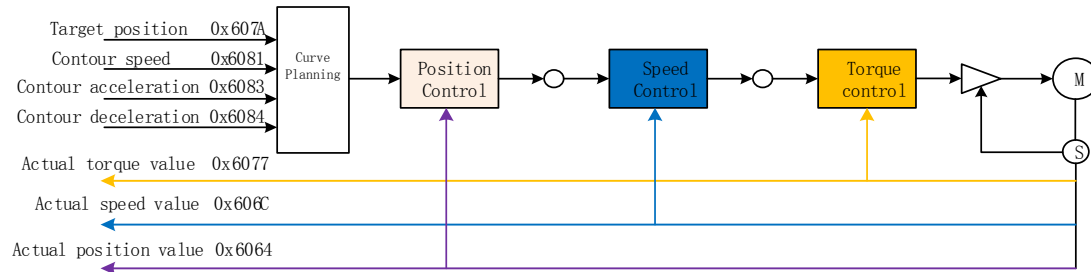

#### 4.6 distributed clock

The distributed clock can make different servo devices use the same system clock, which can ensure that different servos receive instructions at the same time and execute instructions at the same time, which can achieve absolute time synchronization. The slave device can generate a synchronization signal based on the synchronization system time. The SD700-EtherCAT servo drive only supports DC synchronous mode. The synchronization period is controlled by SYNC0 and the period is 125us or an integer multiple of 250us.

### 5. Control mode

## 5.1 contour position mode (pp)

In the contour position mode, the master station sends a dictionary of related objects such as the required target position (absolute or relative), the speed of the position curve, acceleration and deceleration to the servo drive, and the servo driver generates a target curve based on the received related data and commands. instruction.

Curve planning - not immediately updated

1 The main station sends the relevant information of the position command to the slave station according to the need (acceleration time 6083h, deceleration time 6084h, contour speed 6081h, target position 607A);

② master station 6040h of bit4 set to 1 , the detected slave station 6040h of bit4 after the rising edge of the signal, for receiving the displacement new processing instruction.

First, the station determines 6040h of bit5 whether 0, not 0 no correlation processing instruction information;

Next, the slave determines 6040h of bit5 is 0 , and 6041h of bit12 to 0 , from the station 6041h of bit12 is set to 1 , while executing the instruction ① related information. At this point, the slave is unable to continue to receive the new displacement command state.

③ the master station detects the status word 6041h of bit12 is set to 1 , the master station can release the displacement instruction data, the control word and 6040h of bit4 a 1 is set 0 .

④ station detects a control word from 6040h to bit4 is 0 , positioning is completed after the current segment, the 6041h of bit12 is set 0 , indicating that the slave may receive a new shift command.

In the non-immediate update mode, the servo does not process the new displacement command while the current segment is running. The servo can receive and process the new displacement command only after the current segment positioning is completed.

Non-immediate update timing diagram

Control word 6040h of bit6 is 0, the absolute position of the control word 6040h to bit6 is. 1, the relative position.

Location type

Curve planning - update now

1 The main station sends the relevant information of the position command to the slave station according to the need (acceleration time 6083h, deceleration time 6084h, contour speed 6081h, target displacement 607A);

② master station 6040h of bit4 set to 1 , the detected slave station 6040h of bit4 after the rising edge of the signal, for receiving the displacement new processing instruction.

First, the station determines 6040h of bit5 whether one, not one is not related to the information processing instruction;

Next, the slave determines 6040h of bit5 is 1 , and 6041h of bit12 to 0 , from the station 6041h of bit12 is set to 1 , while executing the instruction ① related information. At this point, the slave is unable to continue to receive the new displacement command state.

③ the master station detects the status word 6041h of bit12 is set to 1 , the master station can release the displacement instruction data, the control word and 6040h of bit4 a 1 is set 0 .

④ detected from the station 6040h of bit4 a 1 is set to 0 , the then 6041h of bit12 is set to 0 . Indicates that the slave can receive a new displacement command.

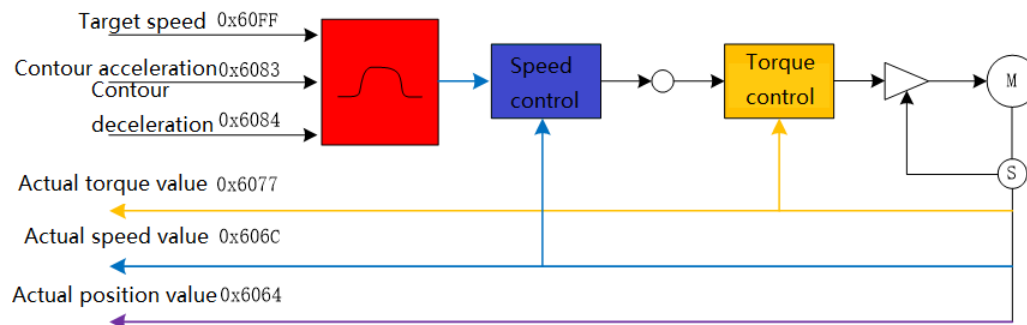

During the Immediate update mode, the current segment is running, is detected from the station to the 6040h of bit4 rising, while 604h of bit12 to 0, the servo displacement may receive a new command process.

Immediate update timing diagram

## 5.2 Contour speed mode (pv)

In the contour speed mode, the master sends the required target speed, acceleration time, and deceleration time to the servo drive, and the servo drive performs speed and torque adjustment.

Note: The speed limit value is determined by the smaller of 0x607F and the maximum motor speed.

### 5.3 Profile Torque Mode (pt)

In the contour torque mode, the primary station transmits the target torque command 6071h, the torque ramp constant 6087h, and the speed limit value 607Fh to the servo drive, which is executed internally by the servo driver. When the speed reaches the limit value of 607Fh, it will enter the speed regulation phase.

## 5.4 cycle synchronous position mode (csp)

In the cyclic synchronous position mode, the primary station transmits the planned target position 607Ah to the servo drive in a periodically synchronized manner according to the value of the target speed 60FFh. Position, speed and torque control are performed inside the servo drive.

## 5.5 cycle synchronous speed mode (csv)

In the cycle synchronous speed mode, the master station sends the calculated target speed 60FFh periodically to the servo drive, and the speed and torque adjustment are internally adjusted by the servo.

Note: The speed limit value is determined by the smaller of 0x607F and the maximum motor speed.

## 5.6 cycle synchronous torque mode (cst)

In the cyclic synchronous torque mode, the master station periodically synchronizes the calculated target torque 6071h to the servo drive, and the torque adjustment is performed internally by the servo. When the speed reaches the limit value, it enters the speed regulation phase.

Note: The speed limit value is determined by the smaller of 0x607F and the maximum motor speed.

## 5.7 zero return mode (hm)

The zero return mode is used to find the mechanical origin and locate the positional relationship between the mechanical origin and the mechanical zero.

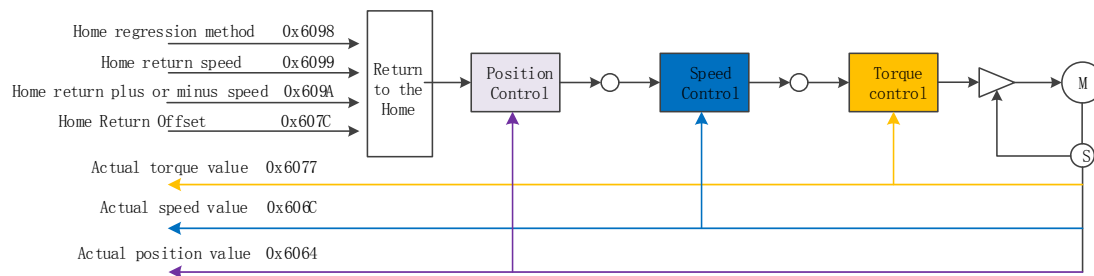

Mechanical origin: A fixed position on the machine that corresponds to a certain origin signal switch.

Mechanical origin = mechanical zero + 607C (origin offset)

Mechanical zero point: Absolute 0 position on the machine.

After the servo drive returns to zero at the origin, the motor stops at the machine origin, and the positional relationship between the machine origin and the mechanical zero is adjusted by setting the value of the object dictionary 0x607C.

#### Introduction to the zero return method:

##### Zero return mode 1 (6098 00h=1)

a Start zero return → Reverse high speed to find negative limit → Hit negative limit rising edge → Deceleration to 0 → Forward low speed to find negative limit falling edge → Forward to find Z pulse

Zero return method 1-a

b Start origin return → Negative limit valid → Positive low speed find negative limit falling edge → Forward find Z pulse

Zero return method 1-b

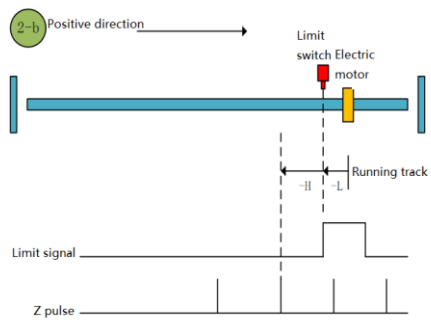

### Zero return mode 2 (6098 00h = 2)

a Start zero return → Forward high speed correction limit → Hit the positive limit rising edge → Decelerate to 0 → Reverse low speed correction limit falling edge → Reverse find Z pulse

Zero return method 2-a

b Start the origin return → positive limit valid → reverse low speed correction limit falling edge → reverse find Z pulse

Origin return mode 2-b

### Zero return mode 3 (6098 00h = 3)

a. Start origin return to zero → Origin signal is OFF → Forward high speed finds the origin signal rising edge → Deceleration to 0 → Reverse low speed finds the origin signal falling edge → Reverse finds Z pulse

Origin return mode 4-b

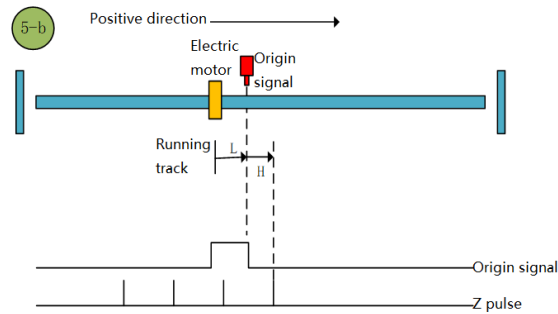

**Zero return mode 5 (6098 00h = 5)**

- a. Start origin return to zero → Origin signal OFF → Reverse high speed to find the origin rising edge → Deceleration to 0 → Forward low speed to find the origin falling edge → Forward to find Z pulse

Zero return method 5-a

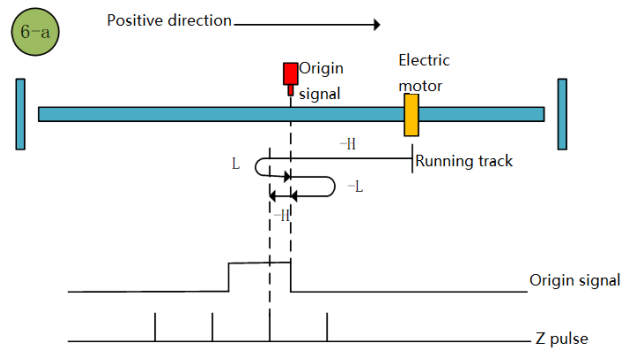

- b. Start origin return to zero → origin signal ON → forward low speed to find the origin falling edge → forward find Z pulse

Origin return mode 5-b

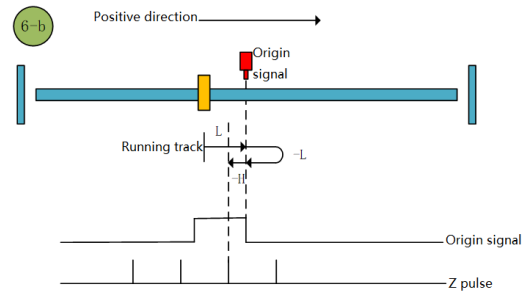

**Origin return mode 6 (6098 00h = 6)**

- a. Start OPR → Origin signal OFF → Reverse high speed to find the origin rising edge → Deceleration to 0 → Forward low speed to find the origin falling edge → Reverse low speed to find the origin rising edge → Reverse to find Z pulse

Origin return mode 6-a

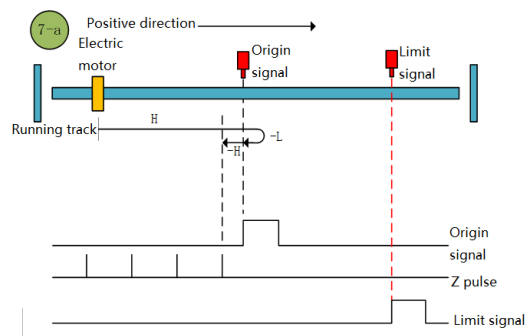

b. Start the origin return → the origin signal ON → the forward low speed to find the origin falling edge → the reverse low speed to find the origin rising edge → reverse to find the Z pulse

Origin return mode 6-b

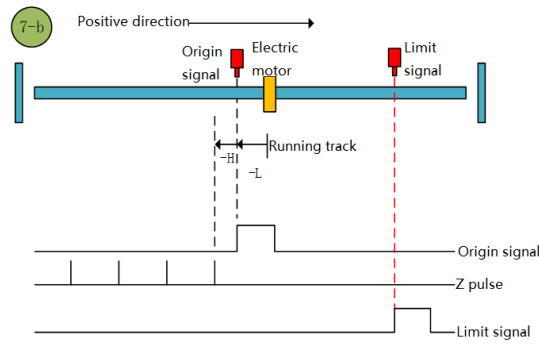

#### Zero return mode 7 (6098 00h = 7)

- Start zero return → Origin signal OFF → Forward high speed to find the origin rising edge → Deceleration to 0 → Reverse low speed to find the origin falling edge → Reverse to find Z pulse
- Start zero return → origin signal ON → reverse low speed to find the origin falling edge → reverse find Z pulse
- Start zero return → origin OFF → forward high speed to find the origin rising edge → hit the positive limit → reverse high speed to find the origin falling edge → decelerate to 0 → forward low speed to find the origin rising edge → reverse low speed to find the origin Find Z pulse along → reverse

Zero return method 7-a

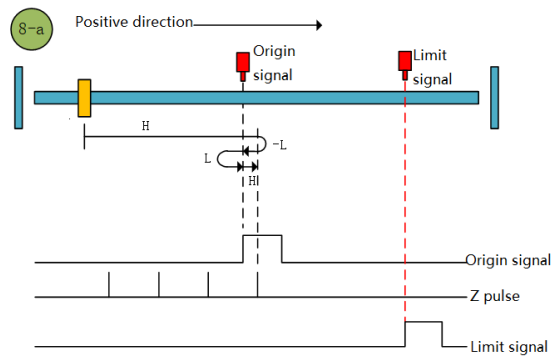

Origin return mode 7-b

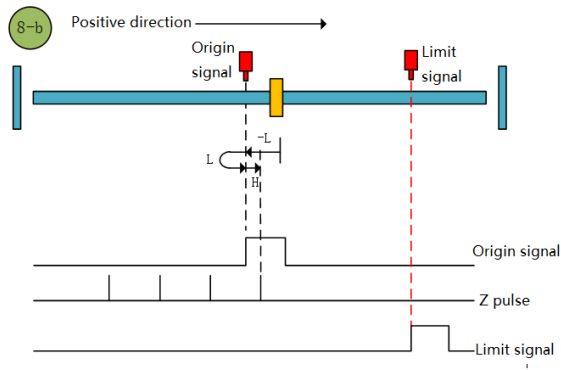

Origin return mode 7-c

#### Origin return mode 8 (6098 00h = 8)

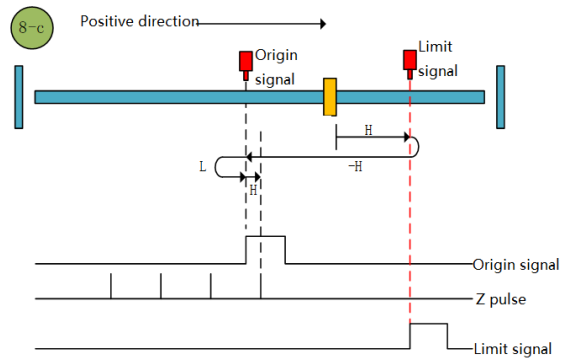

- begins zeroing origin point signal → OFF → positive → rising speed seek decelerate to the origin 0 → → reverse slow to find the falling edge of positive origin to find the origin of the rising edge of the low-speed forward looking → Z pulse
- Start zero return → origin signal ON → reverse low speed to find the origin falling edge → positive low speed to find the origin rising edge → forward find Z pulse
- Start zero return → origin OFF → forward high speed to find the origin rising edge → hit the positive limit → reverse high speed to find the origin falling edge → decelerate to 0 → forward low speed to find the origin rising edge → forward find Z pulse

Origin return mode 8-a

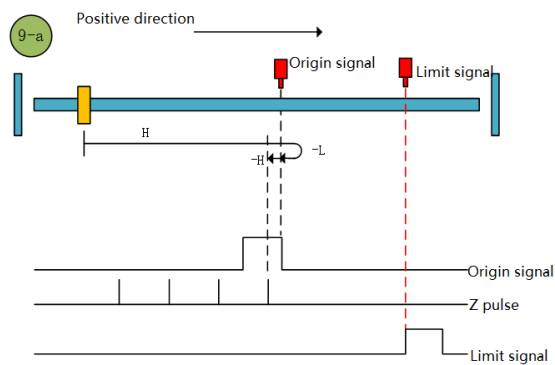

Origin return mode 8-b

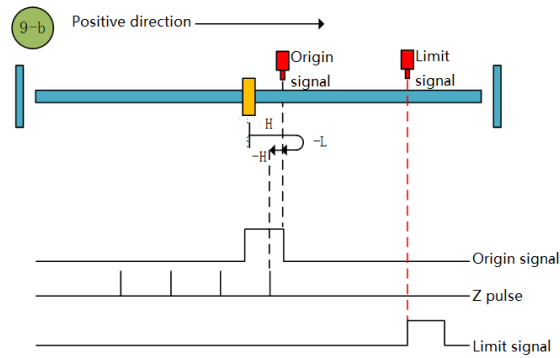

Origin return mode 8-c

#### Zero return mode 9 (6098 00h = 9)

- Start zero return → Origin signal OFF → Forward high speed to find the origin falling edge → Deceleration to 0 → Reverse low speed to find the origin rising edge → Reverse to find Z pulse
- Start zero return → origin signal ON → forward high speed to find the origin falling edge → decelerate to 0 → reverse low speed to find the origin rising edge → reverse find Z pulse
- Start origin return → origin OFF → forward high speed to find the origin falling edge → hit the positive limit → reverse high speed to find the origin rising edge → decelerate to 0 → forward low speed to find the origin falling edge → reverse low speed to find the origin rising edge → Reverse looking for Z pulse

Zero return method 9-a

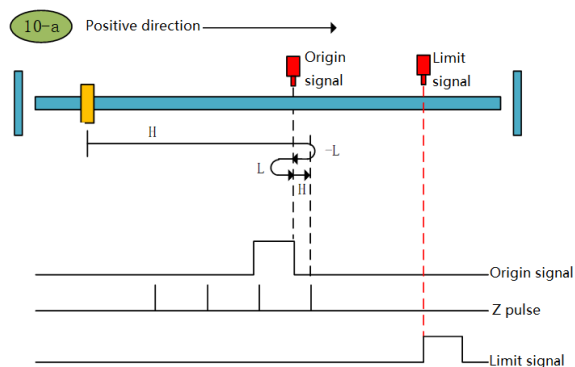

Zero return method 9-b

Zero return method 9-c

#### Zero return mode of origin 10 (6098 00h = 10)

- Start origin return → Origin signal OFF → Forward high speed to find the origin falling edge → Deceleration to 0 → Reverse low speed to find the origin rising edge → Forward low speed to find the origin falling edge → Forward to find Z pulse
- Start origin return → origin signal ON → forward high speed to find the origin falling edge → decelerate to 0 → reverse low speed to find the origin rising edge → positive low speed to find the origin falling edge → forward find Z pulse
- Start zero return → origin OFF → forward high speed to find the origin falling edge → hit the positive limit → reverse high speed to find the origin rising edge → decelerate to 0 → forward low speed to find the origin falling edge → forward find Z pulse

Zero return method 10-a

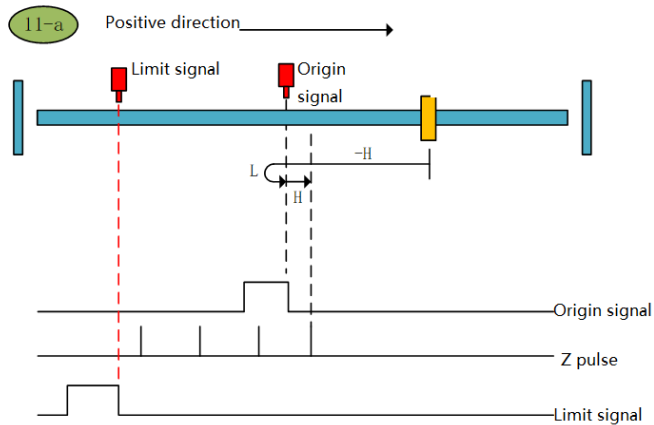

Zero return method 10-b

Zero return method of origin 0 -c

#### Zero return mode of origin (6098 00h = 11)

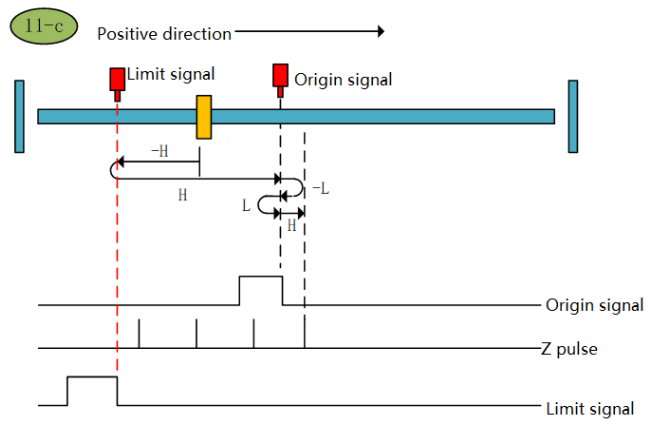

- Origin return to zero → Origin signal OFF → Reverse high speed to find the origin rising edge → Deceleration to 0 → Forward low speed to find the origin falling edge → Forward to find Z pulse
- Origin return to zero → Origin signal ON → Forward low speed to find the origin falling edge → Forward to find Z pulse
- Origin return to zero → Origin signal OFF → Reverse high speed to find the origin rising edge → Hit the negative limit → Forward high speed to find the origin signal falling edge → Deceleration to 0 → Reverse low speed to find the origin rising edge → Forward to find Z pulse

Origin return mode 11-a

Origin return mode 11-b

Origin return mode 11-c

#### Zero return mode of origin 12 (6098 00h = 12)

- Origin return start → Origin signal OFF → Reverse high speed to find the origin rising edge → Deceleration to 0 → Forward low speed to find the origin falling edge → Reverse low speed to find the origin rising edge → Reverse to find the Z pulse
- Origin return start → Origin signal ON → Forward low speed find origin falling edge → Reverse low speed find origin rising edge → Reverse find Z pulse
- Origin return start → Origin signal OFF → Reverse high speed to find the origin rising edge → Hit the negative limit → Forward high speed to find the origin signal falling edge → Decelerate to 0 → Reverse low speed find the origin rising edge → Reverse find Z pulse

Zero return method 12-a

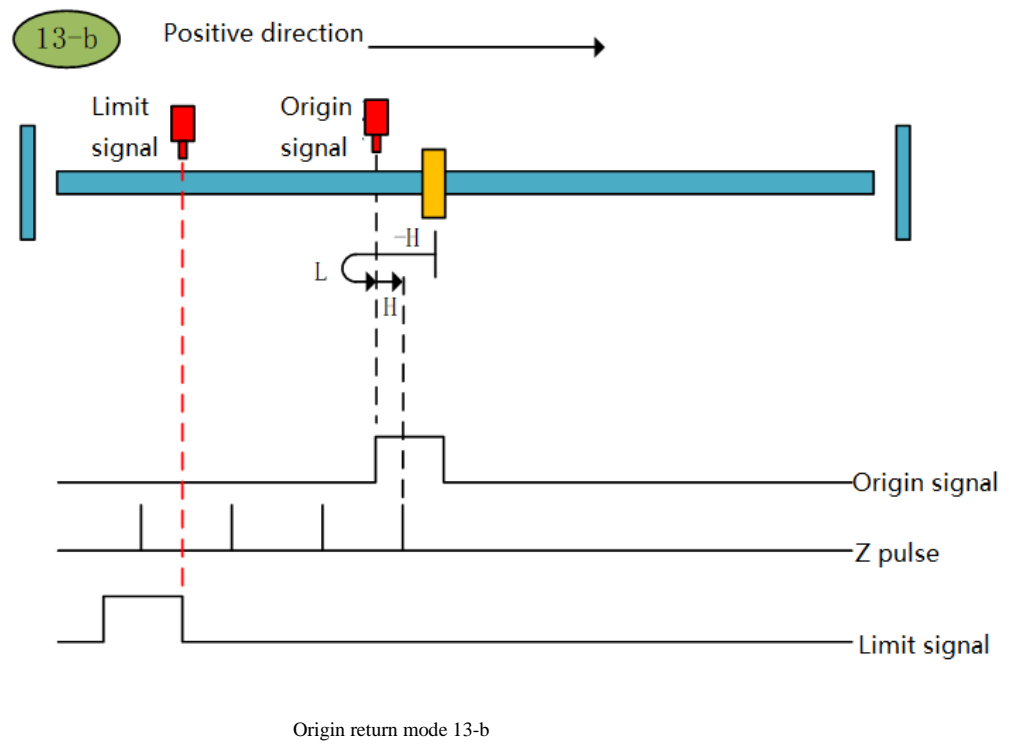

Zero return method 12-b

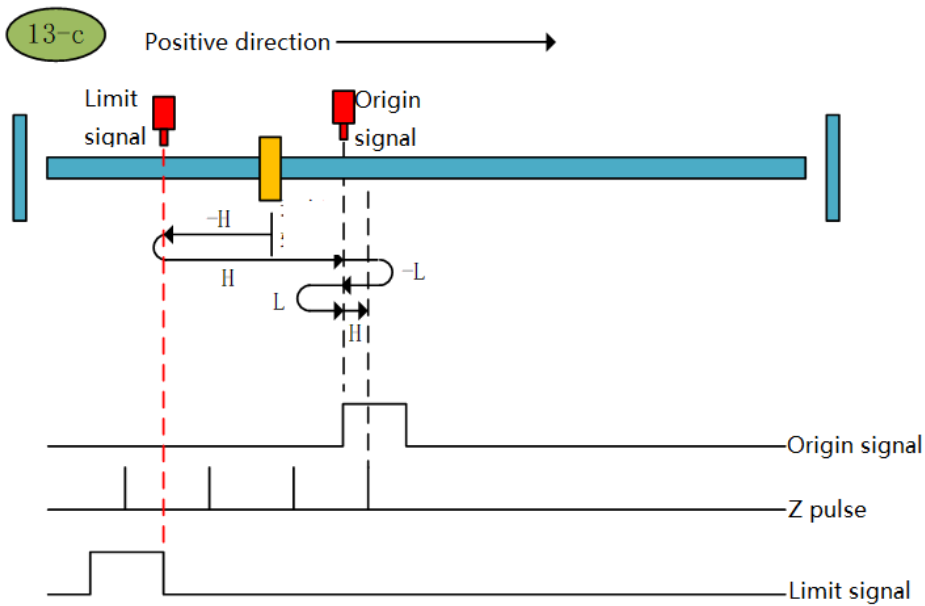

Zero return method 12-c

#### Zero return method of origin (6098 00h = 13)

- Origin return to zero → Origin signal OFF → Reverse high speed to find the origin falling edge → Deceleration to 0 → Forward low speed to find the origin rising edge → Forward to find Z pulse
- Origin return to zero → Origin signal ON → Reverse high speed to find the origin falling edge → Deceleration to 0 → Forward low speed to find the origin rising edge → Forward to find Z pulse
- Origin return start → Origin signal OFF → Reverse high speed to find the origin falling edge → Hit the negative limit → Forward high speed to find the origin signal rising edge → Decelerate to 0 → Reverse low speed to find the origin signal falling edge → Forward low speed Origin signal rising edge → positive looking Z pulse

Origin return mode 13-c

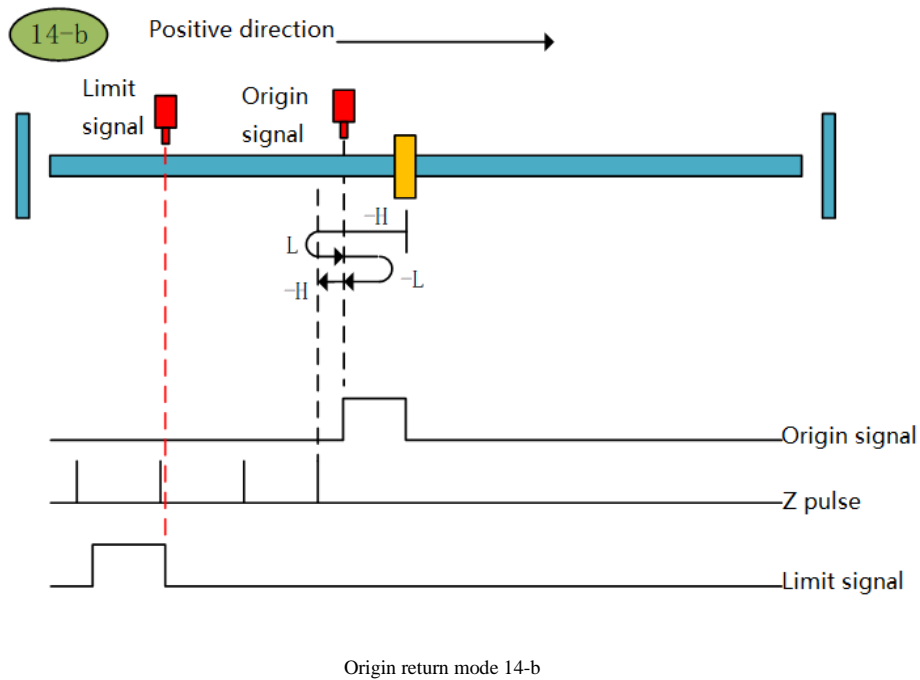

**Zero return method of origin (6098 00h = 14)**

- Origin return start → Origin signal OFF → Reverse high speed to find the origin falling edge → Deceleration to 0 → Forward low speed to find the origin rising edge → Reverse low speed to find the origin falling edge → Reverse to find the Z pulse
- Origin return start → Origin signal ON → Reverse high speed to find the origin falling edge → Deceleration to 0 → Forward low speed to find the origin rising edge → Reverse low speed to find the origin falling edge → Reverse to find Z pulse
- Origin return to zero → Origin signal OFF → Reverse high speed to find the origin falling edge → Hit the negative limit → Forward high speed to find the origin signal rising edge → Deceleration to 0 → Reverse low speed to find the origin signal falling edge → Reverse looking Z pulse

Zero return method 30-b

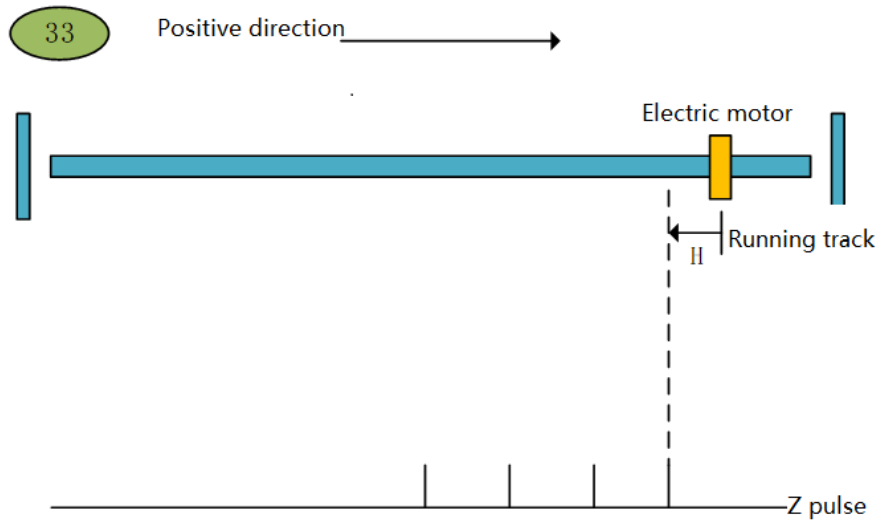

Zero return method 30-c

**Zero return mode 31 (6098 00h = 31): Reserved.**

**Home zero return mode 32 (6098 00h = 32): Reserved.**

**Zero return mode of origin 33 (6098 00h = 33)**

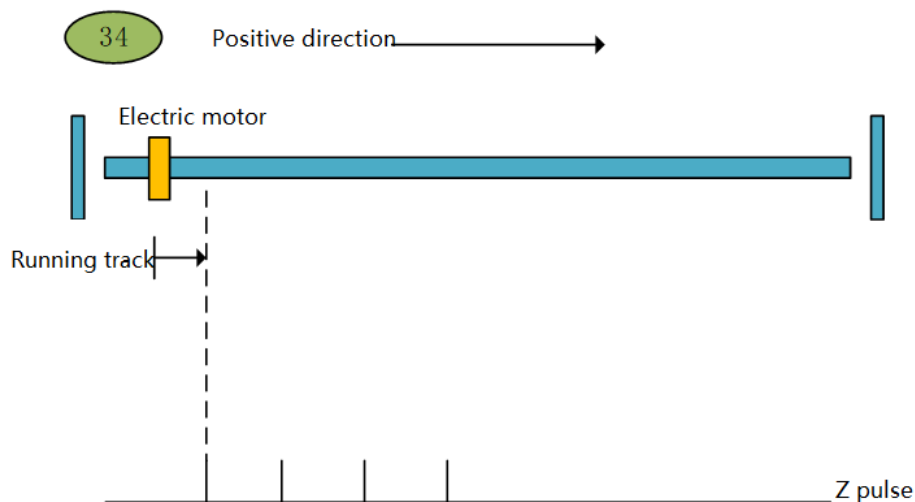

Starting zero return → negative looking for the first Z pulse

Origin return mode 33

**Zero return mode of origin 34 (6098 00h = 34)**

Origin return to zero → forward to find the first Z pulse

Origin return mode 34

## 6. Object Dictionary object dictionary

### 6.1 object attribute description

#### Glossary

" **Index** ": Specify the position of each object in the object dictionary, expressed in hexadecimal (h).

" **Subindex** ": Multiple objects under the same index, each object is offset under this class.

" **Data Type** ": See Table 5-1 for details.

Table 5-1 Description of data types

type of data	Numerical range	Data length	DS301 value
Int8	-128 ~ 127	1 byte	2
UInt8	0 ~ 255	1 byte	5
Int16	-32768 ~ +32767	2 bytes	3
UInt16	0 ~ 65535	2 bytes	6
Int32	-2147483648 ~ +2147483647	4 bytes	4
UInt32	0 ~ 4294967295	4 bytes	7
String	ASCII	-	9

" **Read and write type** ": See Table 4-1 for details.

Table 5-2 Description of read and write types

Read and write type	Description
RW	Read and write
WO	just write
RO	Read only
CONST	Constant, read only

" **Object structure** ": See Table 3-3 for details.

Table 5-3 Description of object structure

Object structure	Description
VAR	A single simple value containing the data types in Table 3-1
ARR	Multiple data field objects, the variables in the fields are all the same data shape
REC	Multiple data field objects, the variables in the fields are different data shapes

## 6.4 Object Dictionary Details

### 6.4.1 Detailed Description of 1000h Group Objects

Object 1000h : Device Type					
<b>Index</b>	1000h				
<b>Name</b>	Equipment type				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RO	<b>Factory default</b>	0x00020 192
Describe the CoE device type:					
		BIT	name	description	
		0~15	Device subprotocol	402 (0x192): device sub-protocol	
		16~23	Types of	02: Servo drive	
		25~31	mode	Factory customization	

Object 1001h : Error Register					
<b>Index</b>	1001h				
<b>Name</b>	Error register				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint8	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RO	<b>Factory default</b>	0
Bitwise to contain error messages					
		BIT	meaning	BIT	meaning
		0	conventional	4	Communication
		1	Current	5	Sub protocol
		2	Voltage	6	Reserved
		3	temperature	7	Vendor definition

Object 1008h : Manufacturer Device Name					
<b>Index</b>	1008h				
<b>Name</b>	Manufacturer equipment name				
<b>Object structure</b>	-	<b>type of data</b>	UINT8	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RO	<b>Factory setting</b>	Servo Device
Describe the manufacturer's device name					

Object 100Ah : Software Version (Software Version)					
<b>Index</b>	100Ah				
<b>Name</b>	Software version				
<b>Object structure</b>	-	<b>type of data</b>	-	<b>data range</b>	-

<b>Can map</b>	NO	<b>Accessibility</b>	RO	<b>Factory default</b>	3761
Describe the software version number					

Object 1018h : ID Object (Identity Object)					
<b>Index</b>	1018h				
<b>Name</b>	ID object				
<b>Object structure</b>	REC	<b>type of data</b>	-	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RO	<b>Factory default</b>	-

<b>Subindex</b>	00h				
<b>Name</b>	Child index number (number of entries)				
<b>Object structure</b>	-	<b>type of data</b>	UINT8	<b>data range</b>	4
<b>Can map</b>	NO	<b>Accessibility</b>	R O	<b>Factory setting</b>	4

<b>Subindex</b>	01h				
<b>Name</b>	Vendor ID (Vendor-ID)				
<b>Object structure</b>	-	<b>type of data</b>	UINT 32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	R O	<b>Factory setting</b>	0x850104
Uniform distribution by ETG manufacturers					

Subindex	02 <sub>h</sub>										
name	Device code (Product Code)										
Object structure	-	type of data	UINT 32	data range	-						
Can map	NO	Accessibility	RO	Factory setting	0x26483052						
The device code corresponds to the product series and product model of the electronic tag, and the corresponding relationship is as follows:											
<table><tr><td>Bit</td><td>0~15</td><td>16~31</td></tr><tr><td>meaning</td><td>Product number</td><td>Product Series</td></tr></table>						Bit	0~15	16~31	meaning	Product number	Product Series
Bit	0~15	16~31									
meaning	Product number	Product Series									

<b>Subindex</b>	03h				
<b>name</b>	Revision number (Revision Number)				
<b>Object structure</b>	-	<b>type of data</b>	UINT 32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	R O	<b>Factory setting</b>	0x37613708

Indicates the upgrade record of the driver software					
	Bit	0~15	16~31		
	meaning	Minor revision	Main revision		

<b>Subindex</b>	04h				
<b>name</b>	Serial number (Serial number)				
<b>Object structure</b>	-	<b>type of data</b>	UINT32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	R O	<b>Factory setting</b>	-
Indicates the software update time (manufacturer's own definition)					

<b>Object 1600h : RPDO1 mapping object (1st Receive PDO Mapping)</b>					
<b>index</b>	1600h				
<b>name</b>	RPDO1 mapping object				
<b>Object structure</b>	REC	<b>type of data</b>	UINT32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<b>Function description:</b> This object can only be modified if the PDO is invalid.					

<b>Subindex</b>	00h				
<b>name</b>	RPDO1 map number (RPDO1 Mapping Numbers)				
<b>Object structure</b>	-	<b>type of data</b>	UINT8	<b>data range</b>	0~8
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	4
Function description: When writing 0 , other sub-index mapping objects are invalid					

<b>Subindex</b>	01h				
<b>name</b>	The first mapping object (Mapping entry (1))				
<b>Object structure</b>	-	<b>type of data</b>	UINT32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x60400010

<b>Subindex</b>	02h				
<b>name</b>	The second mapping object (Mapping entry (2))				
<b>Object structure</b>	-	<b>type of data</b>	UINT32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x607A0020

<b>Subindex</b>	03h				
<b>name</b>	The third mapping object (Mapping entry (3))				

<b>Object structure</b>	-	<b>type of data</b>	UINT32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x60FF0020

<b>Subindex</b>	04h				
<b>name</b>	The fourth mapping object (Mapping entry (4))				
<b>Object structure</b>	-	<b>type of data</b>	UINT32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x60710010

<b>Subindex</b>	05h~08h				
<b>name</b>	Of 5-8 mappings objects (Mapping entry (5) ~ ( 8))				
<b>Object structure</b>	-	<b>type of data</b>	UINT32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	-

<b>Object 1601h : RPDO2 mapping object (2nd Receive PDO Mapping)</b>					
<b>index</b>	1601h				
<b>name</b>	RPDO1 mapping object				
<b>Object structure</b>	REC	<b>type of data</b>	UINT32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<b>Function description:</b> This object can only be modified if the PDO is invalid.					

<b>Subindex</b>	00h				
<b>name</b>	RPDO2 map number (RPDO2 Mapping Numbers)				
<b>Object structure</b>	-	<b>type of data</b>	Uint 8	<b>data range</b>	0~8
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	2
Function description: When writing 0 , other sub-index mapping objects are invalid					

<b>Subindex</b>	01h				
<b>name</b>	The first mapping object (Mapping entry (1))				
<b>Object structure</b>	-	<b>type of data</b>	Uint 32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x60400010

<b>Subindex</b>	02h				
<b>name</b>	The second mapping object (Mapping entry (2))				

<b>Object structure</b>	-	<b>type of data</b>	Uint 32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x607A0020

<b>Subindex</b>	03h~08h				
<b>name</b>	Of 3 to 8 mappings objects (Mapping entry (3) ~ ( 8))				
<b>Object structure</b>	-	<b>type of data</b>	Uint 32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	-

<b>Object 1602h : RPDO3 mapping object (3rd Receive PDO Mapping)</b>					
<b>index</b>	1602h				
<b>name</b>	RPDO1 mapping object				
<b>Object structure</b>	REC	<b>type of data</b>	Uint 32	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<b>Function description:</b> This object can only be modified if the PDO is invalid.					

<b>Subindex</b>	00h				
<b>name</b>	RPDO3 map number (RPDO3 Mapping Numbers)				
<b>Object structure</b>	-	<b>type of data</b>	Uint 8	<b>data range</b>	0~8
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	2
Function description: When writing 0 , other sub-index mapping objects are invalid					

<b>Subindex</b>	01h				
<b>name</b>	The first mapping object (Mapping entry (1))				
<b>Object structure</b>	-	<b>type of data</b>	Uint 32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x60400010

<b>Subindex</b>	02h				
<b>name</b>	The second mapping object (Mapping entry (2))				
<b>Object structure</b>	-	<b>type of data</b>	Uint 32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	0x60FF0020

<b>Subindex</b>	03h~08h				
<b>name</b>	Of 3 to 8 mappings objects (Mapping entry (3) ~ ( 8))				

<b>Object structure</b>	-	<b>type of data</b>	Uint 32	<b>data range</b>	0~ 429496729 5
<b>Can map</b>	NO	<b>Accessibility</b>	R W	<b>Factory setting</b>	-

Object 1603h : RPDO4 mapping object (4th Receive PDO Mapping)					
<b>index</b>	1603h				
<b>name</b>	RPDO4 mapping object				
<b>Object structure</b>	REC	<b>type of data</b>	Uint 32	<b>data range</b>	-

TURE: Synchronous activation with no errors FALSE : Synchronization is not activated or no synchronization error has occurred.					

## 6.4.2 Detailed description of the 6000h group object

Object 603Fh : Error Code ( Error Code )					
<b>index</b>	603Fh				
<b>name</b>	error code				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	NO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
The most recent error in the fault code drive. See the fault list for details.					

Object 6040h : Control Word ( Control Word )	
<b>index</b>	6040h

<b>name</b>	Control word				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0

Control word definition:

Bit	meaning	description
0	Servo ready	0- invalid ; 1- valid
1	Turn on the main loop	0- invalid; 1- valid
2	Rapid shutdown	0- valid; 1- invalid
3	Servo operation	0- invalid ; 1- valid
4~6	Related to mode	-
7	Fault reset	Bit7 rising edge is valid Bit7 remains at 1 , other control commands are invalid.
8	time out	
9~10	NA	Reserved
11~15	Factory customization	Reserved

Bits 4~6 are defined:

Bit	Operating mode			
	Contour position	Contour speed	Contour torque	Zero return mode
4	New location Rising edge trigger	Reserved	Reserved	Zero return
5	0: Not updated immediately 1 : Update now	Reserved	Reserved	Reserved
6	0: absolute position 1 : Relative position	Reserved	Reserved	Reserved

Object 6041h : status word ( the Status Word )					
<b>index</b>	6041h				
<b>name</b>	Status word				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0

Reflect the servo status:

Bit	name	Bit definition
0	Servo no fault	1- valid; 0- invalid
1	Waiting to turn on the servo enable	1- valid; 0- invalid
2	Servo operation	1- valid; 0- invalid
3	malfunction	0: no fault 1 : There is a fault
4	Turn on the main loop	1- valid; 0- invalid
5	Rapid shutdown	0- valid; 1- invalid
6	Servo is not operational	1- valid; 0- invalid
7	caveat	0 : no warning; 1 : warning
8	Factory customization	
9	remote control	0 - Non- CAN open mode. 1-CANopen remote control mode.
10	Target arrival	0 - The target position or speed has not arrived. 1- Target position or speed arrives.
11	Software internal location is out of limits	The 0- position command or feedback did not reach the software internal position limit. 1- position command or feedback reaches the software internal position limit
12	Zero speed signal	Speed mode: 0 -non-zero speed 1- zero speed Position mode: 0- positioning completed 1- positioning is not completed
13		Origin zero return failure flag: 0: zero error does not occur 1: Error occurs when returning to zero ( zero return mode, zero return timeout )
14	NA	Reserved
15	Zero return to origin	0- Home return is not performed or not completed. 1- The zero point of the origin has been completed and the reference point has been found.

**Object 6060h : mode selection ( Modes of Operation )**

index	6060h
name	Mode selection

<b>Object structure</b>	VAR	<b>type of data</b>	Int8	<b>data range</b>	0~10

<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Reflect real-time position feedback (unit: command unit)					

Object 6065h : Position deviation excessive threshold ( Following error Window )					
<b>index</b>	6065h				
<b>name</b>	Position deviation excessive threshold				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	TPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<p>Set the position deviation too large threshold (command unit).</p> <p>When the difference between the user position command 6062h and the user position feedback 6064h exceeds <math>\pm 6065h</math>, a positional deviation excessive fault occurs.</p> <p>When 6065h is set to <math>(2^{32}-1)</math>, the servo does not perform excessive position deviation monitoring.</p>					

Object 6067h : Positional arrival threshold (Position Window)					
<b>index</b>	6067h				
<b>name</b>	Location arrival threshold				
<b>Object structure</b>	VAR	<b>type of data</b>	UInt32	<b>data range</b>	$0 \sim (2^{32}-1)$

<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<p>Set the threshold for the arrival of the position (unit: command unit).</p> <p>The difference between the user position command 6062h and the user actual position feedback 6064h is within <math>\pm 6067h</math>, and when the time reaches 6068h, the position is considered to arrive, and in the contour position mode, the bit 10 of the status word 6041h is =1.</p>					

Object 6068h : Motor Position Time Window (Position Window Time)					
<b>index</b>	6068h				
<b>name</b>	Motor position arrival window time				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
<p>Set the time window for the decision position to arrive (unit: 2ms).</p> <p>The difference between the user position command 6062h and the user actual position feedback 6064h is within <math>\pm 6067h</math>, and when the time reaches 6068h, the position is considered to arrive, and in the contour position mode, the bit 10 of the status word 6041h is =1.</p>					

Object 606Bh : User's actual speed command (Velocity Demand Value)					
<b>index</b>	606Bh				
<b>name</b>	User actual speed command				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	0
<p>Reflects the user's actual speed command (unit: 1rpm).</p> <p>In the position class mode, a speed command corresponding to the output of the position adjuster is reflected;</p> <p>In the speed mode, the input command of the speed regulator is reflected.</p>					

Object 606Ch : User's actual speed feedback (Velocity Actual Value)					
<b>index</b>	606Ch				
<b>name</b>	User actual speed feedback				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	0
Reflects the user's actual speed feedback value (unit: command unit / s).					

Object 606Dh : Speed reaches the threshold speed (Velocity Window)					
<b>index</b>	606Dh				
<b>name</b>	Speed reaches threshold speed				

<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~3000
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
<p>Set the threshold for speed arrival (unit: 1 rpm).</p> <p>Target speed 60FFh user actual speed 606Ch is a difference <math>\pm 606Dh</math> less, and the time to reach 606Eh time, that the speed reaches the speed profile mode, the status word 6041h of Bit10 = . 1. Otherwise the status word 6061h of Bit10 = 0 .</p>					

Object 606Eh : Velocity Window Time					
<b>index</b>	606Eh				
<b>name</b>	Speed arrival time window				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
<p>Set the time window in which the judgment speed reaches the valid (unit: ms).</p> <p>Target speed 60FFh user actual speed 606Ch is a difference <math>\pm 606Dh</math> less, and the time to reach 606Eh time, that the speed reaches the speed profile mode, the status word 6041h of Bit10 = . 1. Otherwise the status word 6061h of Bit10 = 0 .</p>					

Object 606Fh : zero speed threshold (Velocity Threshold)					
<b>index</b>	606Fh				
<b>name</b>	Zero speed threshold				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	10
<p>Set the threshold (unit: 1 rpm) for determining whether the user speed is 0.</p> <p>User feedback speed 606Ch in <math>\pm 606Fh</math> within, and the time to reach 6070h set value indicates that the user rate is 0 , case status word 6041h of bit12 = 1; do not satisfy any of the conditions in both, speed is not considered that the user is 0 , this when the status word 6041h of bit1 2 = 0 .</p>					

Object 6070h : zero speed the time window (Zero the Velocity the Threshold Time)					
<b>index</b>	6070h				
<b>name</b>	Zero speed time window				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0~65535
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
Set the time window (unit: 2 ms) used to determine if the user's speed is zero.					

User feedback speed 606Ch in  $\pm 606Fh$  within, and the time to reach 6070h set value indicates that the user rate is 0, case status word 6041h of bit12 = 1; do not satisfy any of the conditions in both, speed is not considered that the user is 0, this when the status word 6041h of bit1 2 = 0.

Object 6071h : target torque (Target torque)					
index	6071h				
name	Target torque				
Object structure	VAR	type of data	Int16	data range	-3000~3000
Can map	RPDO	Accessibility	RW	Factory default	0
Only used for contour torque mode, torque command target value (unit: 0.1% ).					

Object 6074h : a torque command (the Torque Demand the Value )					
index	6074h				
name	Torque command				
Object structure	VAR	type of data	Int16	data range	-
Can map	TPDO	Accessibility	RO	Factory default	-
Displays the current torque command (unit: 1% ).					

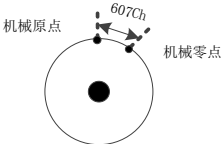

Object 6075h : nominal motor current ( Motor Rated Current )					
index	6075h				
name	Motor rated current				
Object structure	VAR	type of data	Uint32	data range	-
Can map	TPDO	Accessibility	RO	Factory default	-
Rated current on the motor nameplate (unit: mA). All current-related parameter values are related to this parameter.					

Object 6076h : Motor rated torque ( Motor Rated Torque )					
index	6076h				
name	Motor rated torque				
Object structure	VAR	type of data	Uint32	data range	0~(2 <sup>32</sup> -1)
Can map	TPDO	Accessibility	RO	Factory default	-
Rated torque on the motor nameplate (unit: m Nm). All torque related parameter values are related to this parameter.					

Object 6077h : motor feedback torque (T orque Actual the Value)					
index	6077h				
name	Motor feedback torque				

<b>Object structure</b>	VAR	<b>type of data</b>	Int16	<b>data range</b>	-
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
The instantaneous torque output of the response servo motor (unit: 1% ).					

Object 607Ah : target position (Target Position)					
<b>index</b>	607Ah				
<b>name</b>	target location				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Set the servo target position (unit: command unit ) in the contour position mode and cycle synchronization position mode .					

Object 607Ch : Home Offset ( Hmoe Offset )					
<b>index</b>	607Ch				
<b>name</b>	Origin offset				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
<p>In the position class control mode, the mechanical zero deviates from the physical position of the motor origin (unit: encoder unit).</p> <p>Mechanical origin = mechanical zero + 607Ch (origin offset). When set to 0, the origin is unbiased.</p> 					

Object 607Dh : Software absolute position limit ( Software Limit position )					
<b>index</b>	607Dh				
<b>name</b>	Software absolute position limit				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	-
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<p>Set the minimum and maximum values for the absolute position limit of the software.</p> <p>Minimum absolute position limit = (607D-1h)</p> <p>Maximum absolute position limit = (607D-2h)</p> <p>Software absolute position limit setting:</p> <p>1. When both (607D-1h) and (607D-2h) are set to the default values, the software limit does not take effect.</p>					

2. AL931 warning will occur when the minimum absolute position limit (607D-1h) is greater than the maximum absolute position limit (607D-2h).
3. When the position command or position feedback reaches the software limit value, in the position mode, the servo will operate with the position limit as the target position, stop at the position limit, and prompt the overtravel warning AL950. Entering the reverse command will cause the motor to exit the position overrun condition.

<b>Subindex</b>	00h				
<b>name</b>	Number of sub-indexes for absolute position restrictions				
<b>Object structure</b>	-	<b>type of data</b>	Uint8	<b>data range</b>	-
<b>Can map</b>	NO	<b>Accessibility</b>	R O	<b>Factory setting</b>	2

<b>Subindex</b>	01h				
<b>name</b>	Minimum software absolute position limit (Min Position Limit)				
<b>Object structure</b>	-	<b>type of data</b>	Uint8	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	R W	<b>Factory setting</b>	$-2^{31}$

<b>Subindex</b>	02h				
<b>name</b>	Maximum software absolute position limit (Max Position Limit)				
<b>Object structure</b>	-	<b>type of data</b>	Uint8	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	R W	<b>Factory setting</b>	$2^{31}-1$

#### Object 607Eh : Command Polarity ( Polarity )

<b>index</b>	607Eh				
<b>name</b>	Command polarity				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint8	<b>data range</b>	0-255
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0

Reflects the polarity of the position command or speed command.

B it	7	6	5	4~0
meaning	Position command polarity	Speed command polarity	Torque command polarity	Reserved

Bit7=1, indicating the standard position mode, the position command  $\times (-1)$ , the motor is reversed. In the contour position mode and the cycle synchronous position mode, the position command and the target position are inverted.

Bit6=1 means that the speed command (60FFh)  $\times (-1)$  will be reversed in the speed mode .

#### Object 607Fh : Max Profile Velocity

<b>index</b>	607Fh				
<b>name</b>	Maximum contour speed				

<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	0~(2 <sup>32</sup> -1)
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	50000
Maximum user speed (unit: 0.1rpm). The set value takes effect when the slave speed command changes.					

Object 6080h : Max Motor Velocity					
<b>index</b>	6080h				
<b>name</b>	Maximum motor speed				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	0~(2 <sup>32</sup> -1)
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	6000
The maximum permissible operating speed of the motor can be obtained from the instruction manual of the servo motor (unit: rpm )					

Object 6081h : Profile Velocity					
<b>index</b>	6081h				
<b>name</b>	Contour speed				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	0~(2 <sup>32</sup> -1)
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	10000000
In the contour position mode, the running speed of the uniform speed section reached after the acceleration section is completed (unit: command unit / s).  $\text{motor speed} = \frac{6081h \times \frac{6091h - 1}{6091h - 2}}{\text{Encoder resolution}} \times 60$					

Object 6083h : Acceleration profile (Profile Acceleration )					
<b>index</b>	6083h				
<b>name</b>	Contour acceleration				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	0~(2 <sup>32</sup> -1)
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	200
Lower profile mode, from the motor 0rpm accelerated to the speed reference acceleration (unit: Command / S <sup>2</sup> ). After the slave receives the segment shift command, the set value takes effect.					

Object 6084h : Profile Deceleration					
<b>index</b>	6084h				

<b>name</b>	Profile deceleration				
<b>Object structure</b>	VAR	<b>type of data</b>	UInt32	<b>data range</b>	0~( $2^{32}-1$ )
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	200
<p>The speed profile mode, from the motor speed is decelerated to the current 0rpm deceleration (unit: Command / S<sup>2</sup>).</p> <p>After the slave receives the segment shift command, the set value takes effect.</p>					

Object 6086h : Motor Run Curve Type					
<b>index</b>	6086h				
<b>name</b>	Motor running curve type				
<b>Object structure</b>	VAR	<b>type of data</b>	Int16	<b>data range</b>	$-2^{15} \sim (2^{15}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
<p>The type of curve for the motor position command or speed command.</p> <p>0- linear</p>					

Object 6087h : torque ramp ( the Torque S Lope )					
<b>index</b>	6087h				
<b>name</b>	Torque ramp				
<b>Object structure</b>	VAR	<b>type of data</b>	UInt32	<b>data range</b>	0~( $2^{32}-1$ )
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
<p>In the contour torque mode, it indicates the time (in ms ) that the torque given amount has risen from 0% of the rated torque to 100% .</p>					

Object 6091h : gear ratio (Gear Ratio )					
<b>index</b>	6091h				
<b>name</b>	Gear ratio				
<b>Object structure</b>	VAR	<b>type of data</b>	UInt32	<b>data range</b>	-
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	-
<p>The position factor is used to establish the proportional relationship between the load displacement specified by the user and the motor displacement:</p> <p>Motor displacement (motor unit) = load displacement (user unit) × position factor</p> <p>The position factor setting is related to the mechanical reduction ratio, mechanical size related parameters, and motor resolution.</p> <p>The calculation method is as follows:</p>					

$$\text{Position factor} = \frac{\text{Motor resolution} \times \text{gear ratio}}{\text{Load feed}}$$

<b>Subindex</b>	00h

<b>Can map</b>	NO	<b>Accessibility</b>	R O	<b>Factory setting</b>	2

<b>Subindex</b>	01h				
<b>name</b>	Search deceleration point signal speed (Speed During Search for Switch)				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	$0 \sim (2^{32}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	R W	<b>Factory setting</b>	27962026

<b>Subindex</b>	02h				
<b>name</b>	Search for the speed of the origin signal (Speed During Search for Zero)				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint32	<b>data range</b>	$0 \sim (2^{32}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	R W	<b>Factory setting</b>	5592405

<b>Object 609Ah : Homing Acceleration</b>					
<b>index</b>	609Ah				
<b>name</b>	<b>Zero return acceleration</b>				
<b>Object structure</b>	ARR	<b>type of data</b>	Uint32	<b>data range</b>	$0 \sim (2^{32}-1)$
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	16000
<p>Set the acceleration in the home return mode.</p> <p>The object dictionary unit is defined as the position instruction increment per second ( command unit / s <sup>2</sup> ).</p>					

<b>Object 60B0h : position offset ( the Position offset )</b>					
<b>index</b>	60B0h				
<b>name</b>	<b>Position offset</b>				
<b>Object structure</b>	ARR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$

<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0
Used to synchronize the position command offset amount in the cycle position mode, servo target position = 607Ah + 60B0h .					

#### Object 60B8h : Probe Function ( Touch Probe Function )

<b>index</b>	60B8h				
<b>name</b>	Probe function				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	0

I.e. the probe feature position latch function, can latch the external DI signal or the electrical machine Z position information of the signals change. This servo supports two probe functions to latch 4 position information. Probe 1 can be selected DI44 or Z signal as a probe signal, the probe 2 can select DI45 or Z signal as a probe signal.

The function of probe 1 and probe 2:

Bit	description	Range
0	Probe 1 enable	0--- Probe 1 is not enabled 1--- Probe 1 enabled
1	Probe 1 trigger mode	0--- single trigger 1--- Continuous trigger
2	Probe 1 trigger signal selection	0---DI44 input signal 1---Z signal
3	NA	
4	Probe 1 rising edge, falling edge selection	0--- falling edge latch 1--- rising edge latch
5-7	NA	
8	Probe 2 enable	0--- Probe 2 is not enabled 1--- Probe 2 enabled
9	Probe 2 trigger mode	0--- single trigger 1--- Continuous trigger
10	Probe 2 trigger signal selection	0---DI45 input signal 1---Z signal
11	NA	
12	Probe 2 rising edge, falling edge selection	0--- falling edge latch 1--- rising edge latch
13-15	NA	

#### Object 60B9h : Probe Status ( Touch Probe Status )

<b>index</b>	60B9h				
<b>name</b>	Probe status				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	0
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	0
The state of probe 1 and probe 2.					
	<b>Bit</b>	<b>description</b>	<b>Remarks</b>		
	0	0--- Probe 1 is not enabled 1--- Probe 1 enabled			
	1	0 — Probe 1 rising edge latch is not executed 1 — Probe 1 rising edge latch has been executed			
	2	0 — Probe 1 falling edge latch is not executed 1 — Probe 1 falling edge latch has been executed			
	3~5	NA			
	6	0 — DI44 input signal 1 — Z signal			
	7	0 — DI44 is low 1 — DI44 is high			
	8	0--- Probe 2 is not enabled 1--- Probe 2 enabled			
	9	0 — Probe 2 rising edge latch is not executed 1 — Probe 2 rising edge latch has been executed			
	10	0 — Probe 2 falling edge latch is not executed 1 — Probe 2 falling edge latch has been executed			
	11~13	NA			
	14	0 — DI45 input signal 1 — Z signal			
	15	0 — DI45 is low 1 — DI45 is high			

**Object 60BAh : Probe 1 rising edge position feedback ( Touch Probe Pos1 Pos Value )**

<b>index</b>	60BAh
<b>name</b>	Probe 1 rising edge position feedback

<b>Object structure</b>	VAR	<b>type of data</b>	<b>Int32</b>	<b>data range</b>	-
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Displays the rising edge of the probe 1 signal and the position feedback (command unit).					

Object 60BBh : Probe 1 Falling Edge Position Feedback ( Touch Probe Pos1 Neg Value )					
<b>index</b>	60BBh				
<b>name</b>	Probe 1 falling edge position feedback				
<b>Object structure</b>	VAR	<b>type of data</b>	<b>Int32</b>	<b>data range</b>	-
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Displays the falling edge of the probe 1 signal and the position feedback (command unit).					

Object 60BCh : Probe 2 rising edge position feedback ( Touch Probe Pos1 Pos Value )					
<b>index</b>	60BCh				
<b>name</b>	Probe 2 rising edge position feedback				
<b>Object structure</b>	VAR	<b>type of data</b>	<b>Int32</b>	<b>data range</b>	-
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Displays the rising edge of the probe 2 signal and the position feedback (command unit).					

Object 60BDh : Probe 1 Falling Edge Position Feedback ( Touch Probe Pos2 Neg Value )					
<b>index</b>	60BDh				
<b>name</b>	Probe 2 falling edge position feedback				
<b>Object structure</b>	VAR	<b>type of data</b>	<b>Int32</b>	<b>data range</b>	-
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Displays the falling edge of the probe 2 signal and the position feedback (command unit).					

Object 60E0h : Forward torque limit value ( Positive Torque limit )					
<b>index</b>	60E0h				
<b>name</b>	Forward torque limit				
<b>Object structure</b>	VAR	<b>type of data</b>	<b>Uint16</b>	<b>data range</b>	<b>0~3000</b>
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	3000
Limit the maximum forward torque (in 0.1% ).					

Object 60E1h : Negative to the torque limit value ( Negative Torque limit )					
---	--	--	--	--	--

<b>index</b>	<b>60E1h</b>				
<b>name</b>	Negative torque limit				
<b>Object structure</b>	VAR	<b>type of data</b>	Uint16	<b>data range</b>	<b>0~3000</b>
<b>Can map</b>	RPDO	<b>Accessibility</b>	RW	<b>Factory default</b>	3000
Limit the maximum negative torque (in 0.1% ).					

Object 60F4h : positional deviation (Following Error Actual Value)					
<b>index</b>	<b>60F4h</b>				
<b>name</b>	Position deviation				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Display position deviation (command unit).					

Object 60FCh : position command ( the Position the Value Demand )					
<b>index</b>	<b>60FCh</b>				
<b>name</b>	Position command				
<b>Object structure</b>	VAR	<b>type of data</b>	Int32	<b>data range</b>	$-2^{31} \sim (2^{31}-1)$
<b>Can map</b>	TPDO	<b>Accessibility</b>	RO	<b>Factory default</b>	-
Motor real-time position command Position command (6062h) × electronic gear ratio (609 1 h) = motor position command ( 60FCh )					

Object 60FDh : Digital Input							
index	60FDh

## 7.2 warning code

Fault display	Fault name	error code	Auxiliary code
AL.900	Position deviation is too large	0x900	0x700
AL.901	Excessive position deviation when servo ON	0x901	0x701
AL.910	Overload warning	0x910	0x710
AL.911	Vibration warning	0x911	0x711
AL.920	Regenerative overload warning	0x920	0x720
AL.921	DB overload warning	0x921	0x7 21
AL.930	Battery undervoltage warning	0x930	0x7 3 0
AL.931	The software limit 607Dh is abnormally set.	0x931	0x7 31
AL.940	The origin is offset outside the soft limit	0x940	0x7 4 0
AL.941	Parameter change warning that requires power failure	0x941	0x7 41
AL.942	EtherCAT control mode setting is abnormal	0x942	0x7 42
AL.950	Position exceeds the soft limit	0x950	0x7 50
AL.971	Undervoltage warning	0x971	0x700
AL.9A0	Overtravel warning	0x9A0	0x7 A0
AL.9B0	SYNC0 sync frame is lost	0x9B0	0x7 B0
AL.9F0	Distributed clock cycle setting exception ( 125us integer multiple)	0x9F0	0x7 F0

## 7.3 Communication failure recovery method

For the fault of the servo drive itself, please refer to the corresponding manual. This section only describes the processing method of the EtherCAT communication part.

1) Er.023: Unburned xml configuration file

the reason	Treatment
Unburned configuration file	Burn configuration file
Drive failure	Replace the servo drive

2) Er.EB9: EtherCAT initialization exception

the reason	Treatment
Unburned configuration file	Burn configuration file
Drive failure	Replace the servo drive
Unburned FPGA code	Burn FPGA code

3) AL.931: The software limit 607D is set abnormally.

the reason	Treatment
The minimum limit value of 607Dh is greater than the maximum limit value.	Change 607Dh maximum limit value or minimum limit value

4) AL.940: The origin is offset outside the soft limit

the reason	Treatment
607Ch is set larger than the 607Dh limit value	Change the value of 607Dh or 607Ch

5) AL.942: EtherCAT control mode setting is abnormal

the reason	Treatment
Object dictionary 6060h is set incorrectly	Modify the setting value of 6060h

6) AL.950: Position exceeds the soft limit

the reason	Treatment
Target position 607Ah or actual position 6064h exceeds the limit of 607Dh	Change the value of 607Dh or 607Ah

7) AL.9b0: SYNC0 sync frame is lost

the reason	Treatment
Slave receives an exception during synchronous communication	1. Use shielded twisted pair 2. View the wiring status through the digital display of the keyboard
The master sends an exception when synchronizing communication	Replace the master station equipment

8) AL.9F0: Distribution clock cycle setting is abnormal

the reason	Treatment
The synchronization period is not an integer multiple of 125us	Modify the synchronization period setting to an integer multiple of 125us

## 8 with the Beckhoff main station operation example

The following example is a system configuration using Beckhoff TwinCAT 2.110.2252 software with Beckhoff controller CX9020. Please install the TWinCAT software correctly before configuring the software.

1. Firstly connect the servo driver correctly and supply power, and set the first digit of function code Pn000 to 1.
2. Copy the VEICHI XML file to the folder where TwinCAT is installed (the path is usually: C:\TwinCAT\IO\EtherCAT);
3. Restart TwinCAT.
4. Open the TwinCAT System Manager as shown below and start the configuration process.

5. New project [" FILE " → " New "]

6. Connect the CX9020 and the servo drive and supply power.
7. Start searching for the CX9020 controller.

8. Click on " Broadcast Search "

9. Select as shown below and click on “ Add Route ”

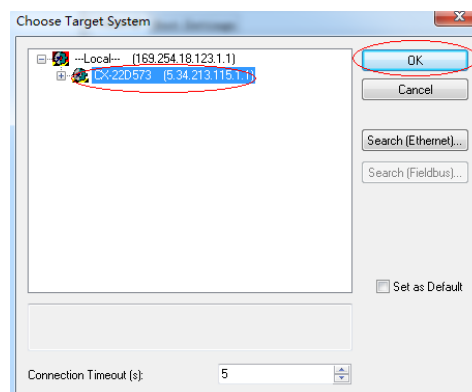

10. Click "OK"

11. The "X" mark appears to indicate that it is connected, click "Close"

12. Select as shown below

13. Put TwinCAT in configuration mode, click on the image below

14. Right click on " I/O Device " to search for the servo device

15. Click "OK"

16. Select " EtherCAT "

17. Select "Yes" to enable EtherCAT device detection.

18. When the following window pops up, click No

19. Turn off the monitoring error function

20. Set the pulse coefficient

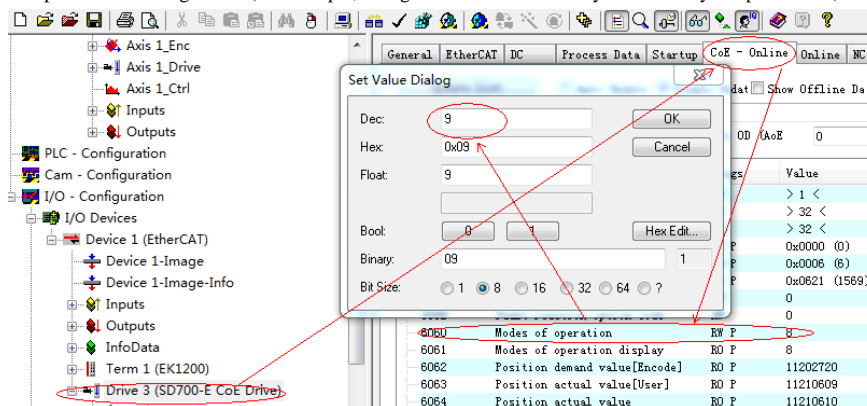

If the setting is 60mm, the number of pulses per cycle is  $60/2^{-24}$  (assuming a 24-bit encoder).

21. Set the speed output coefficient (used in speed mode)

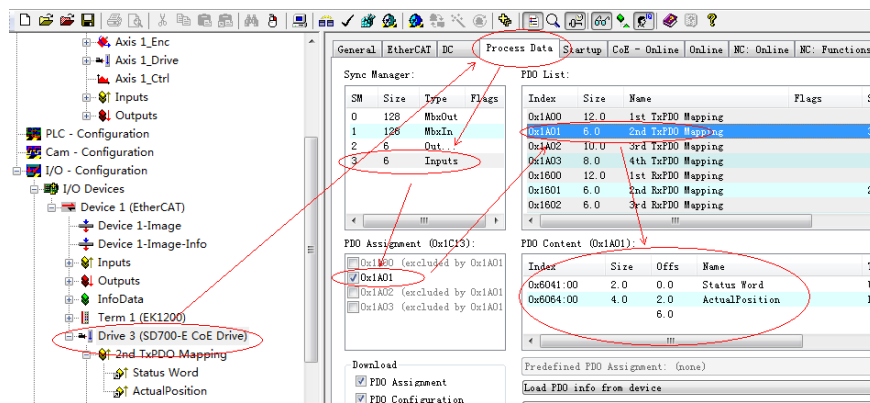

22. Set the relevant parameters through SDO (for example, change the control mode to synchronous cycle speed mode)

23. Configure PDO

PDO mapping parameter defaults to 1601h and 1A01h, can arbitrarily change the RPDO and TPDO mapping parameters, but can only check 1 Ge RPDO and 1 Ge TPDO. The contents of the mapping object can be added and deleted, but it is recommended that the total number of bytes of the mapping object does not exceed 52 bytes.

24. Distributed clock cycle setting (set cycle time according to specific conditions, default 2ms)

25. Activation configuration

26. Click "Yes"

27. Click "OK"

28. When the window below appears, click OK to make TwinCAT running.

## 29. Enable Servo Drive

## 30. Jog operation

# 9 . With the OMRON main station operation example

## 9.1 Preparation

1. Install sysmac studio software, it is recommended to install version 1.09 and above.
  2. Place the device description file of Flextronics " VEICHL\_SD700-E\_Rev4\_XML\_ET1100\_20190228.xml " and above into the specified path : OMRON\Sysmac Studio\IO DeviceProfiles\EsiFiles\UserEsiFiles
- For the first time, change the file to this path and you need to restart the sysmac studio software .
3. Set the network connection properties of the computer :
- To connect the computer to the NJ controller , you need to set the TCP/IP properties of the computer :

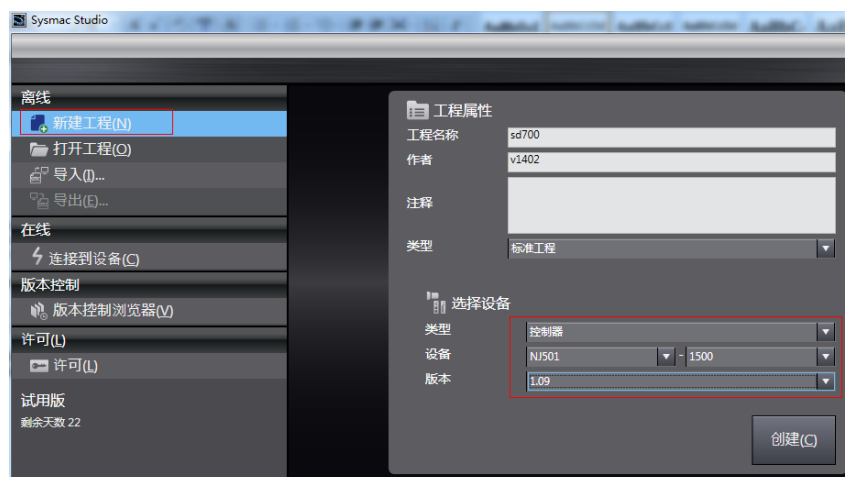

4. Confirm that the servo drive ARM software version is " 3762 " and above.

5. Since the OMRON master station cannot automatically assign the station address to the slave station, the slave station needs to manually set the node address. The SD700 sets the site alias , that is, the communication station number, through **Pn080** . It is recommended to set the station number according to the actual physical connection order in order to manage the configuration.

## 9.2 Omron background software configuration

### 9.2.1 New construction

Select the controller type and software version, it is recommended that the software select version 1.09 or higher.

### 9.2.2 Communication Settings

After entering the main interface, click the menu bar "Controller" - "Communication Settings", select the Ethernet-Hub connection, type the controller network address, and click " Ethernet Communication Test ". If there are no problems, the test will be successful.

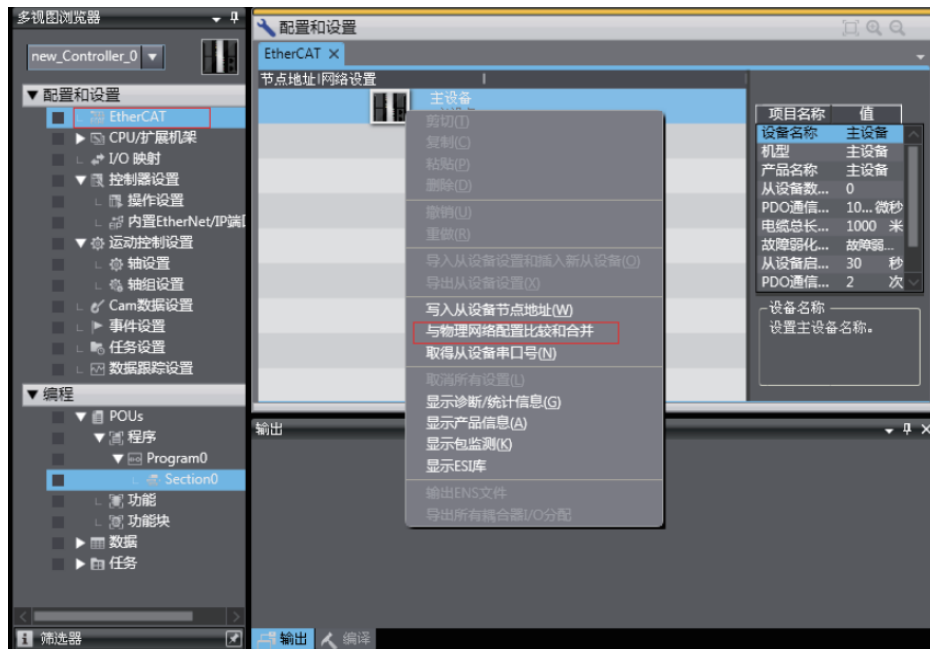

## 9.2.3 Scanning equipment

Switch the controller to "online" mode.

Scan the slave and add

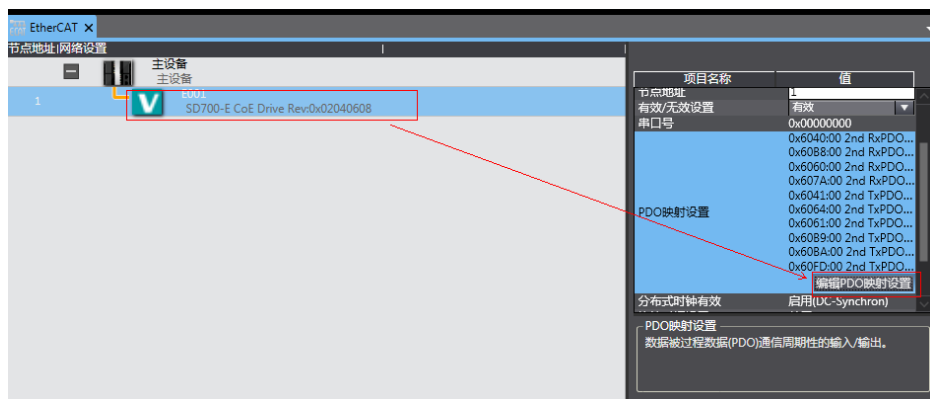

In the left menu bar "Configuration and Settings", click "EtherCAT", right-click "Master Device", and select "Compare with physical network configuration." The controller then automatically scans all slaves in the network. After scanning, click "Apply Physical Network Configuration", then the slave is added. On the main page you can see the added SD700 slaves. As shown below.

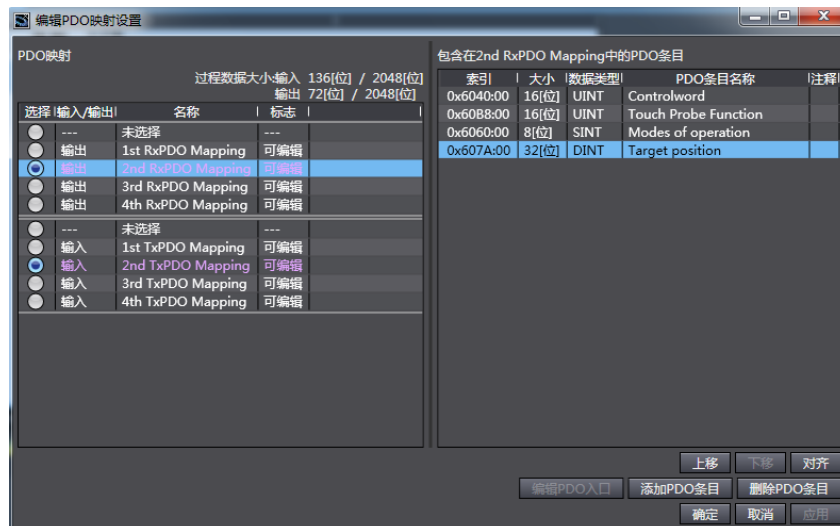

## 9.2.4 Parameter Configuration

Switch the controller to the offline mode and configure the PDO, DC clock, axis parameters, and so on.

Click on the scanned SD700 slave and click on "Compile PDO Mapping Configuration" on the right. After opening the can see the default choice TPDO and RPDO can change the input and output, change after, and can be for PDO content mapping that is added or deleted.

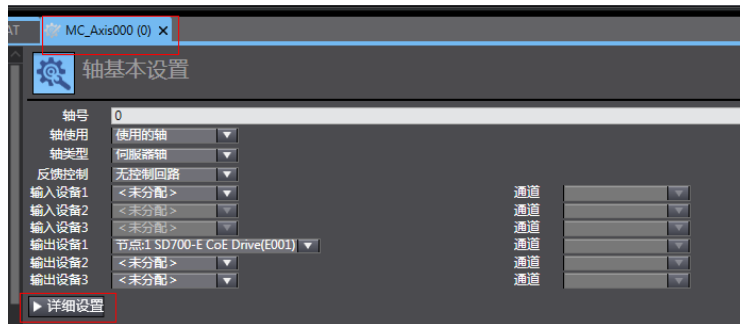

Among them, the object dictionary 0x6060 and the object dictionary 0x60B8 must be mapped, otherwise the primary station will report an error.

Right-click on "Motion Control Settings" - "Axis Settings" to add "Motion Control Axis". Then make the basic settings of the axis.

Set the basic settings of the axis as shown below, click "Detailed Settings"

After clicking on the detailed settings, you can expand the "Output", "Input" and "Digital Input". It is recommended to assign the corresponding content as shown in the figure below.

Output (controller to device):

▼ 详细设置			
恢复默认值			
	功能名称	设备	过程数据

The actual motor resolution setting "motor revolution 1 the number of turns of the command pulse" (such as 23 is registration motor revolution is selected 8388608 pulses). The working stroke of the motor can be kept as default by one week. The electronic gear ratio is no longer set inside the servo.

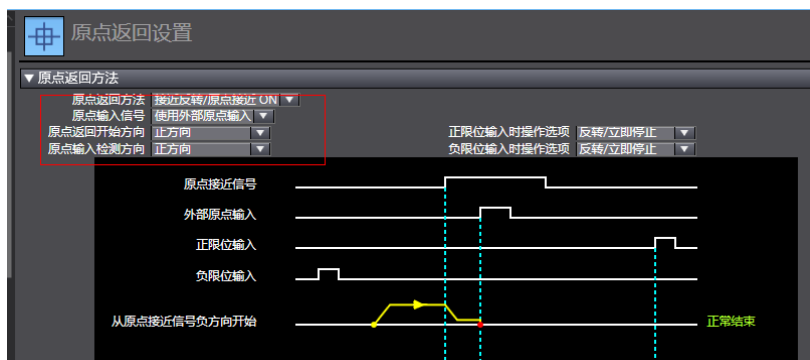

Set the speed, acceleration, deceleration, etc. according to the conversion of the unit. The acceleration or deceleration is 0 , indicating that the running curve is planned with the maximum acceleration or deceleration.

The limit function can be selected according to the actual situation.

Use the following figure to set the OPR method and method.

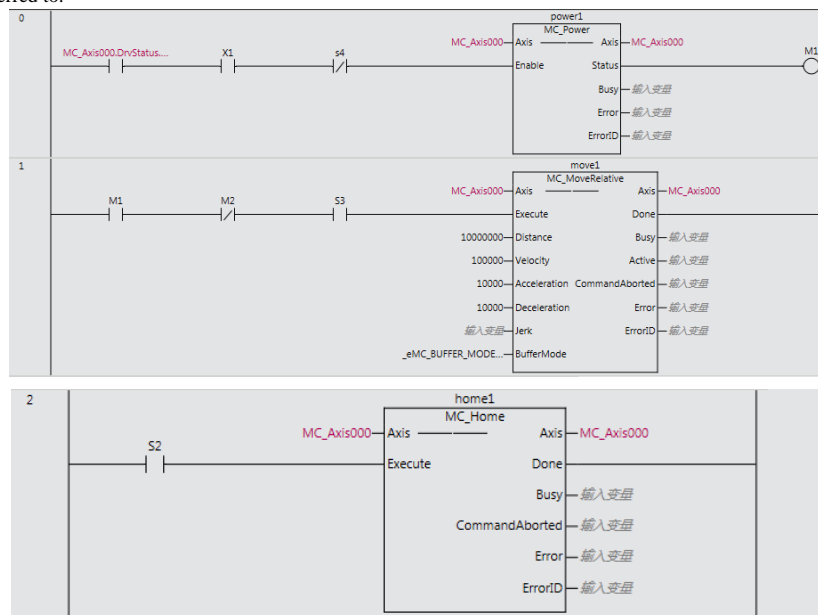

Setting the origin return method requires attention, the cooperation between the servo and the host computer function, refer to the following table.

NJ software description	Servo response function	Terminal configuration
Origin approach signal	Origin switch	DI38-DI41 , DI46
External origin input	Probe 1 or probe 2	DI44 or DI45
Z phase input	Motor encoder Z- phase signal	-
Positive limit input	Positive limit	DI38-DI41 , DI46
Negative limit input	Negative limit	DI38-DI41 , DI46

The distributed clock cycle can be set by the following figure

After the configuration is completed, the servo operation can be controlled by the PLC program. The following is a programming example, which can be referred to.

After all configuration and programming is completed, switch to the online state and execute the download to the controller. After that, you can run the program and click the corresponding switch in the PLC program to drive the servo.
